

# Positronium intensity measurement preparation (GBAR)

SNU

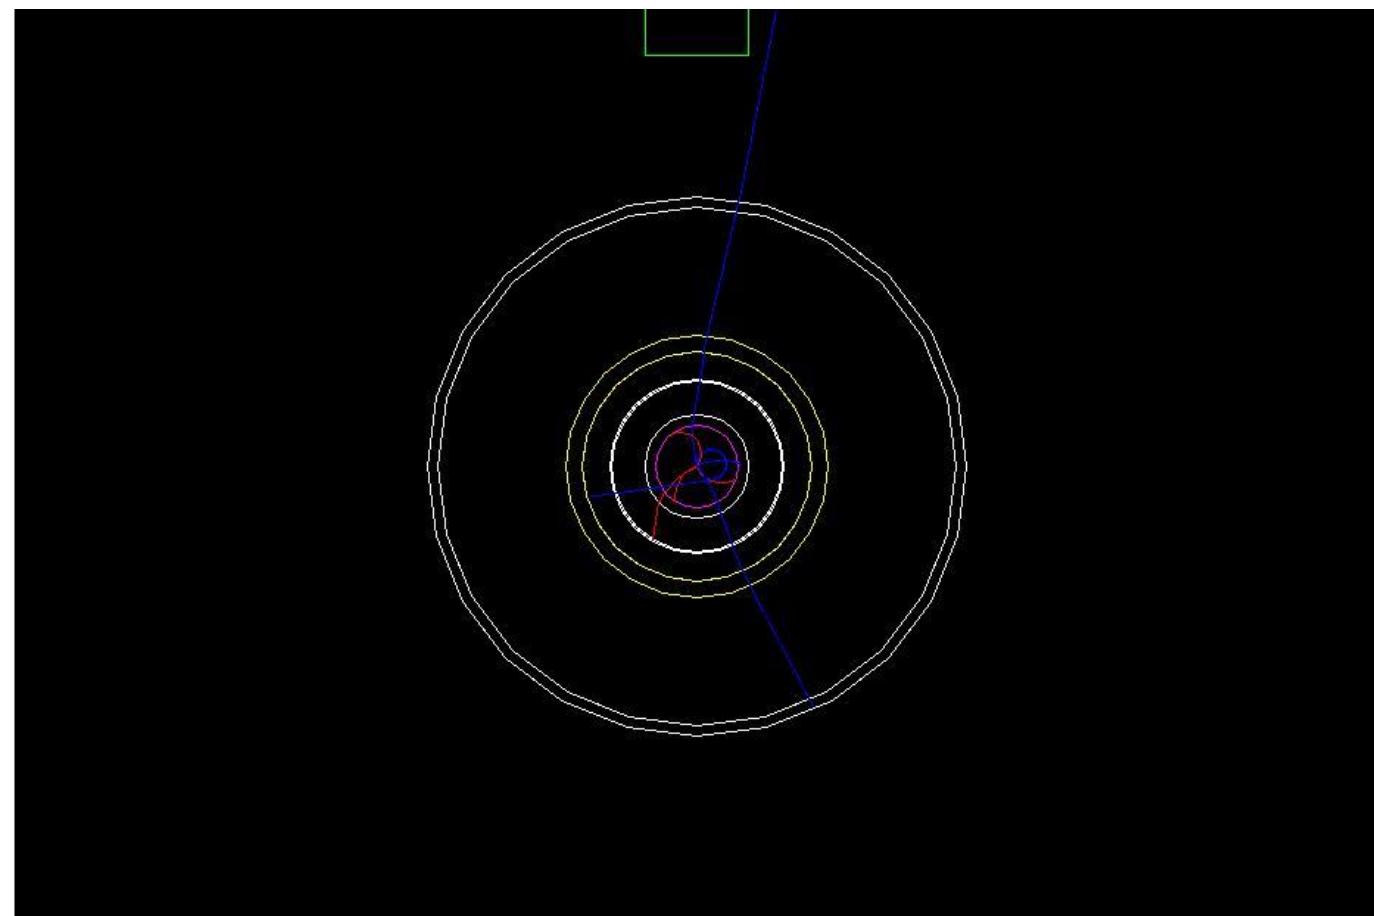

Bongho Kim

# Anti-proton (beam pipe?)monitor simulation

From the center  
Pink : Beam pipe  
White : Tube  
Yellow : Solenoid  
White : Shield  
Green : Detector

# Anti-proton (beam pipe?)monitor simulation

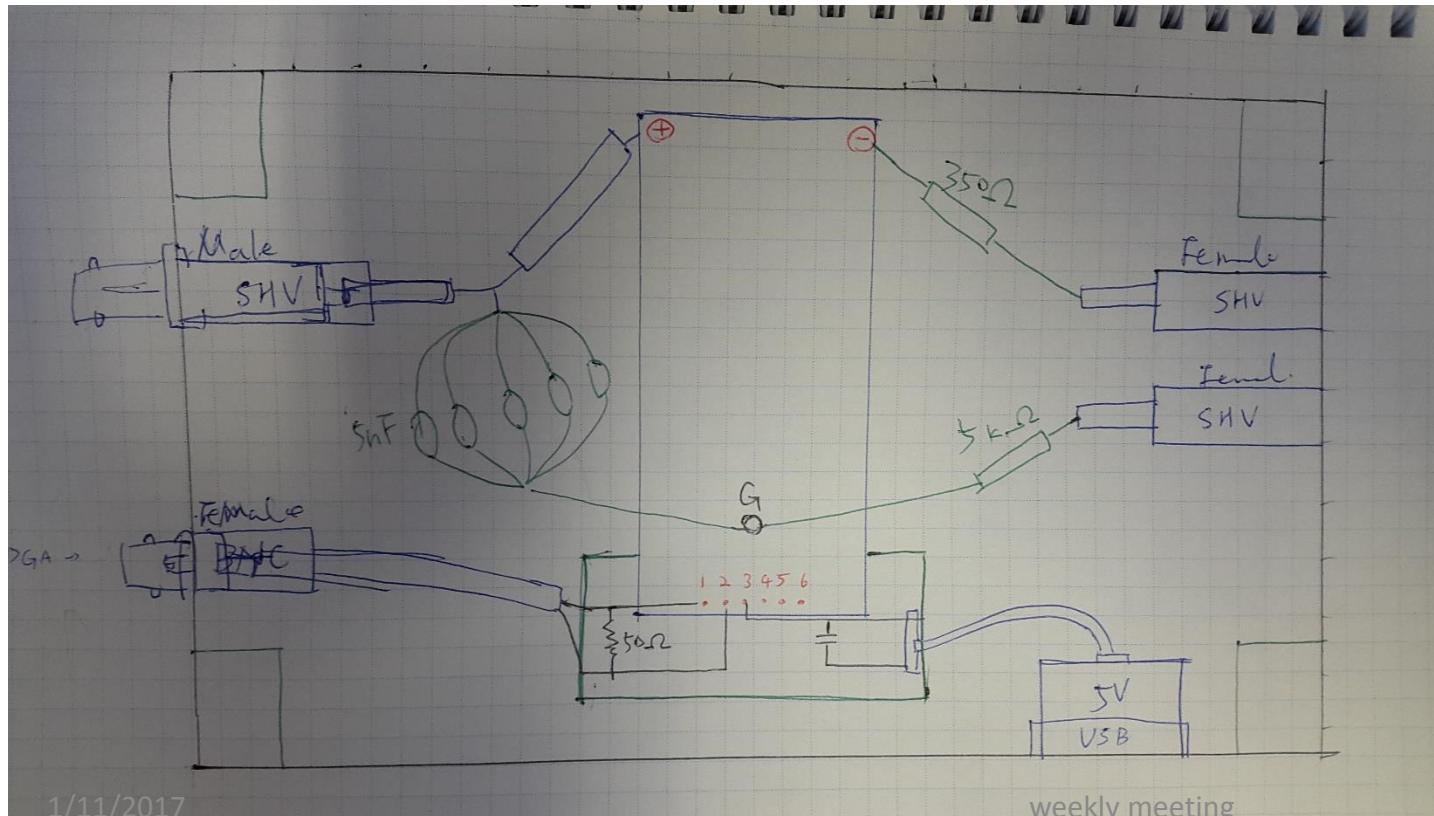

Parameters

Part	Radius(cm)	Length(cm)	Thickness(cm)	
Beam pipe	4	127.6	1	Cu (BeCu)
Beam tube	8.225	127.6	0.2	SUS
Solenoid	11	180	1.6	Ti-Nb
Shield	25	180	1	Fe
B-field	5	110		5T
Pressure				1e-12Torr
Anti-P	3	100		Uniform

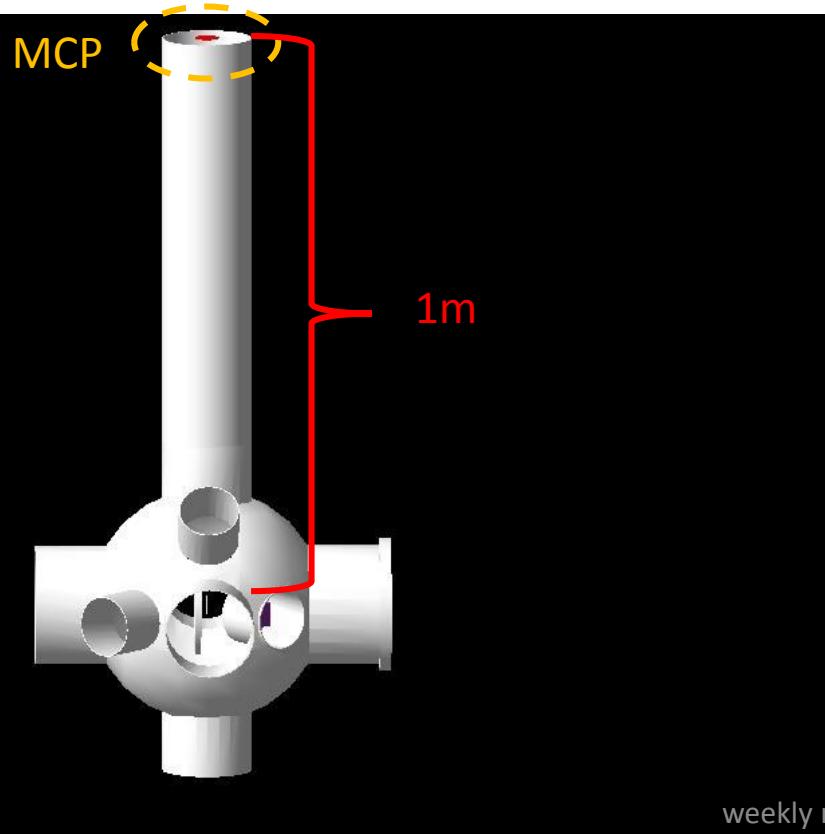

# Antion project preparation help

- Buncher switch design is done
  - Fast High voltage switch (1ns rising time)

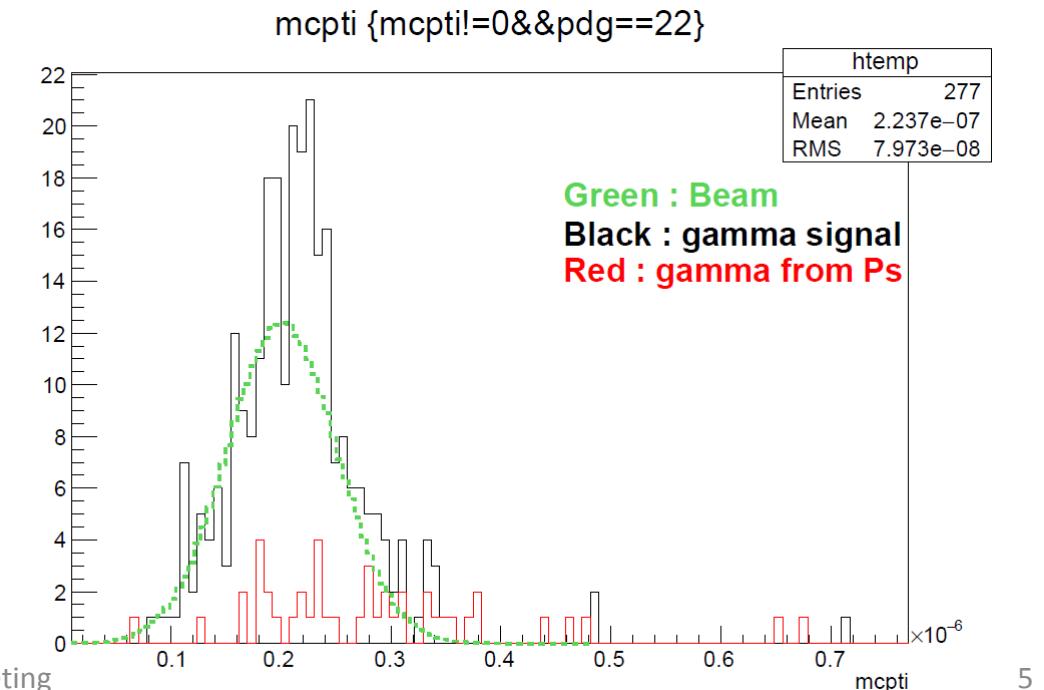

# Simulation for gamma background check

- For 1.e6 positron beam, 277# gamma hit the MCP and 44# are come from Ortho-positronium annihilation.
- Delayed gamma from O-Ps can be background for H signal at MCP.
- For 10keV P beam,  $v = 1.385e+6\text{m/s}$  (0.72us) → High statistics check required.

1/11/2017

weekly meeting

# Status in CEA Saclay

- Patrice move to CERN → Yves has charge for GBAR in CEA Saclay
- Next week : e+ beam usable ( cathode heating now)
- End of January : p beam usable
- 1<sup>st</sup>, March : decelerator move to CERN (Orsay Univ)
- New Oscilloscope usable for PWO detector (HDO6054, 500MHz, 2.5GS/s)
- SPSC meeting at CERN (17<sup>th</sup>, Jan)

# Next step

- 17<sup>th</sup>,Jan : Visit CERN for SPSC meeting

## To do list

- W block holder design
- Mail to all for sharing information group (with GitLab information)
- PWO detector with positron beam
- Simulation for anti-P monitor
- Simulation for antion project
