

Low Temperature R&D

19/05/14

Jae Jin Choi, Govinda Adhikari, Gyunho Yu, Chang Hyon Ha, Seo Hyun Lee

Low Temperature Experiment

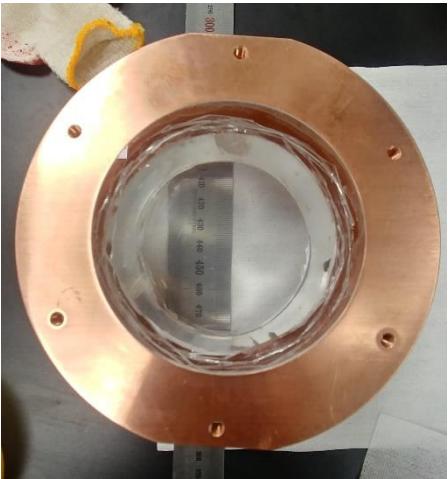

Contents

- Experiment Setup
- PSD between alpha and gamma according to temperature change
- PSD between neutron and gamma according to temperature change

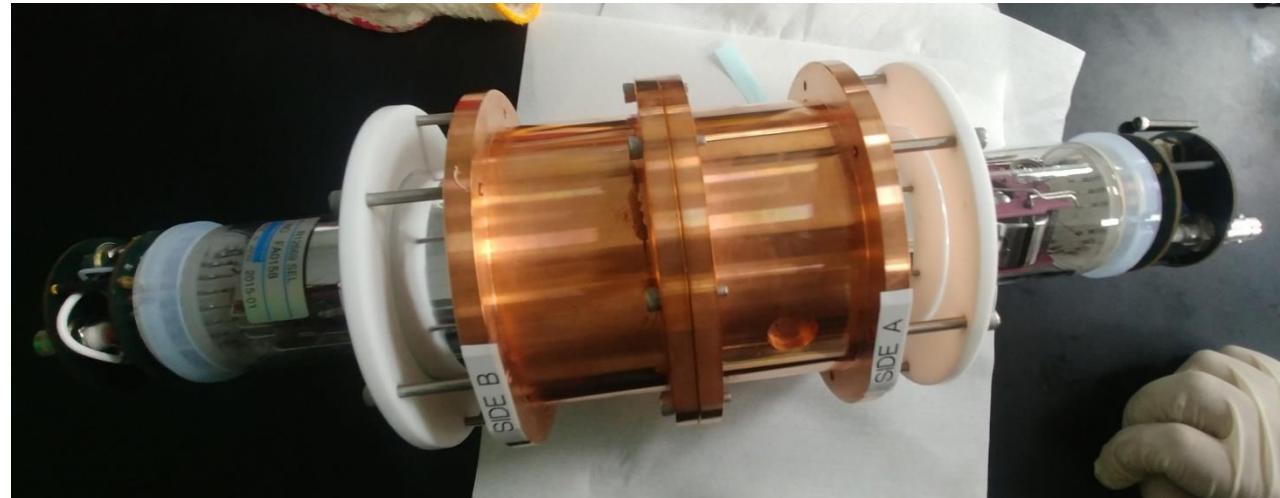

Purpose of Low Temperature Experiment

- To check light yield of NaI crystal according to temperature change
- To observe PSD(alpha, neutron, beta/gamma) when temperature goes down
- To measure PMT noise as a function of temperature

Low Temperature R&D NaI(Tl) Crystal(NaI-031)

2019-05-16

- NaI-031(SICCAS)
 - diameter : 75mm, height : 75mm
 - Weight(expected) : 1.2 ± 0.12 kg
 - Alpha Activity : 0.73 ± 0.16 mBq/kg
- PMT(SIDE A) : FA0056
- PMT(SIDE B) : FA0158

Low Temperature Experiment

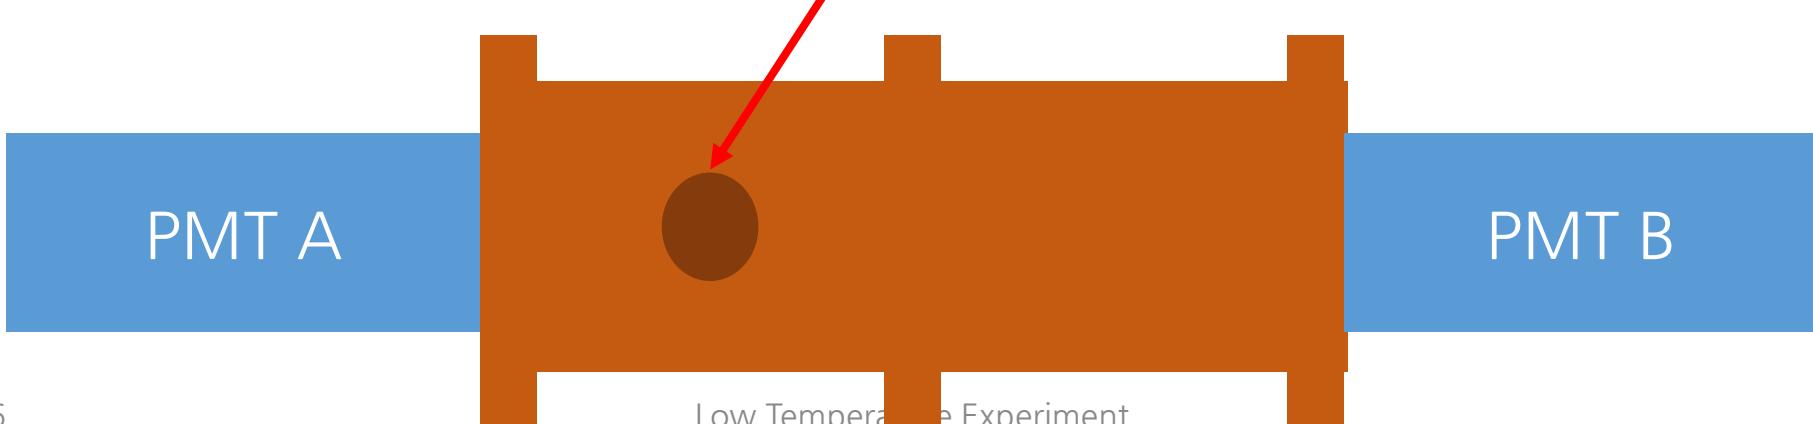

Experiment Setup

- We took data at 20 °C and -33 °C

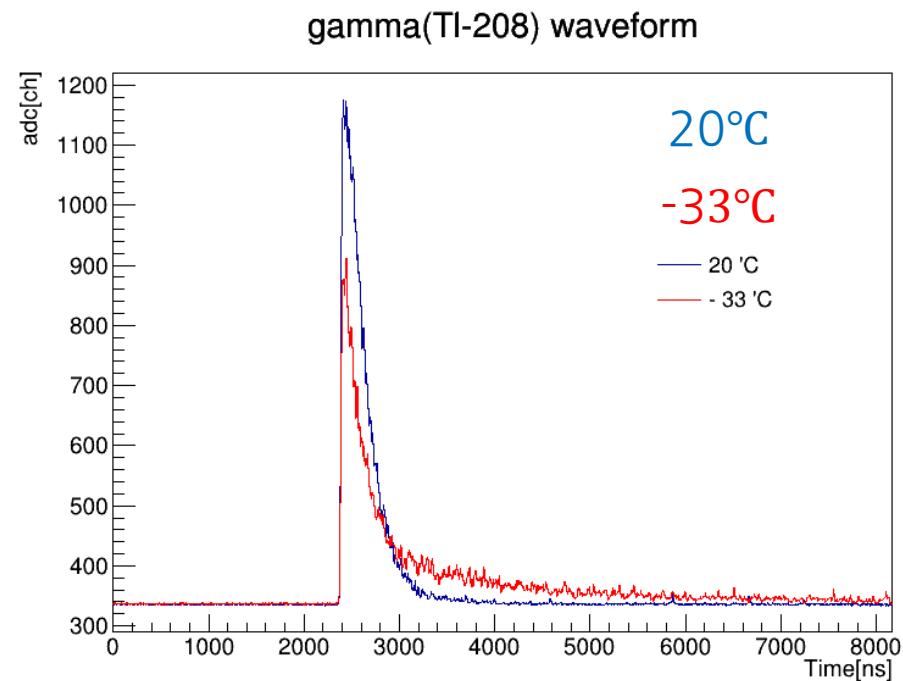

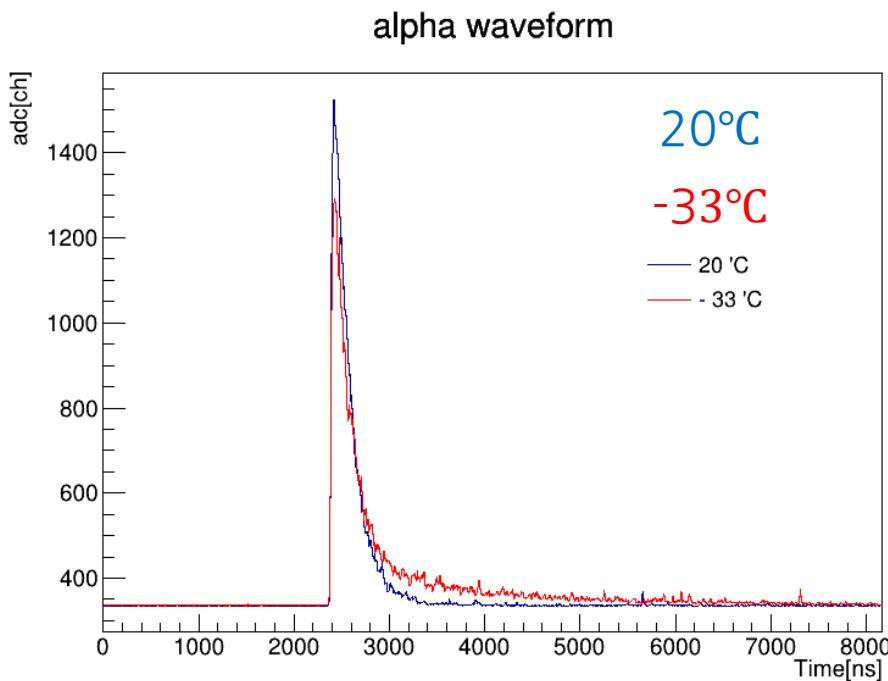

- Refrigerator(-33 °C)

Source position(for calibration)

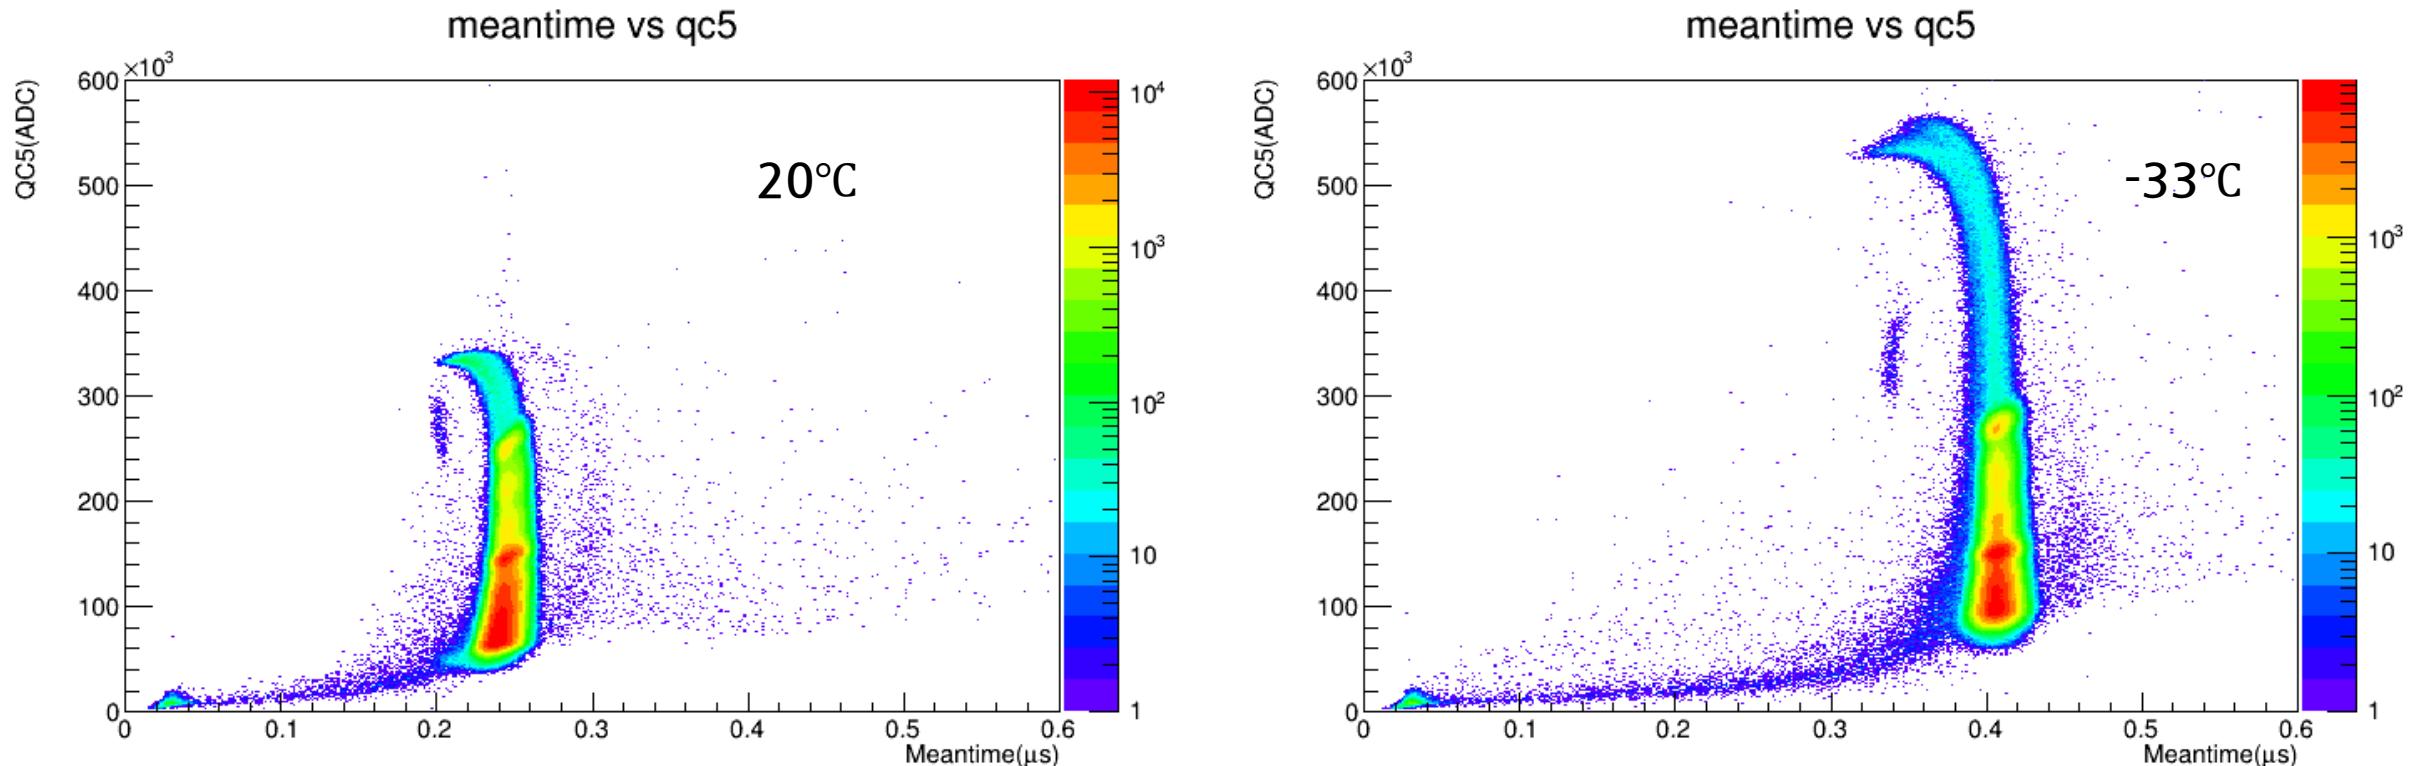

PSD(alpha, gamma)

- Raw waveform

- height at room temperature is higher than height at low temperature
- wave decay time at room temperature is faster than wave decay time at low temperature

PSD(alpha, gamma)

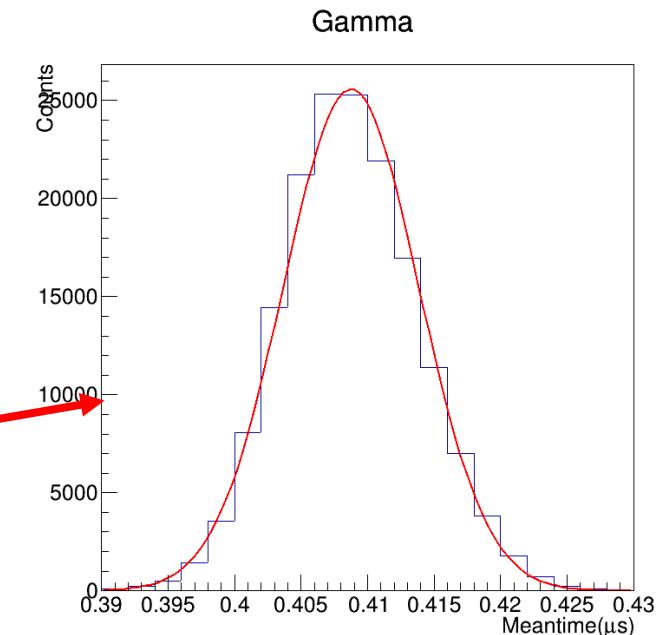

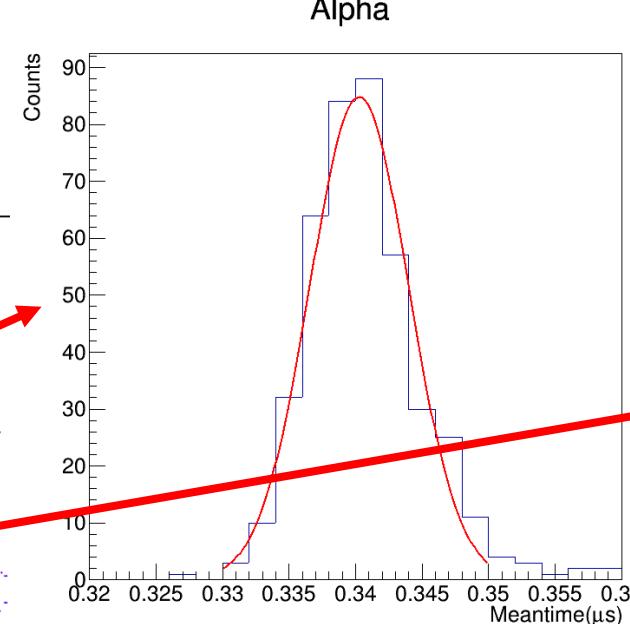

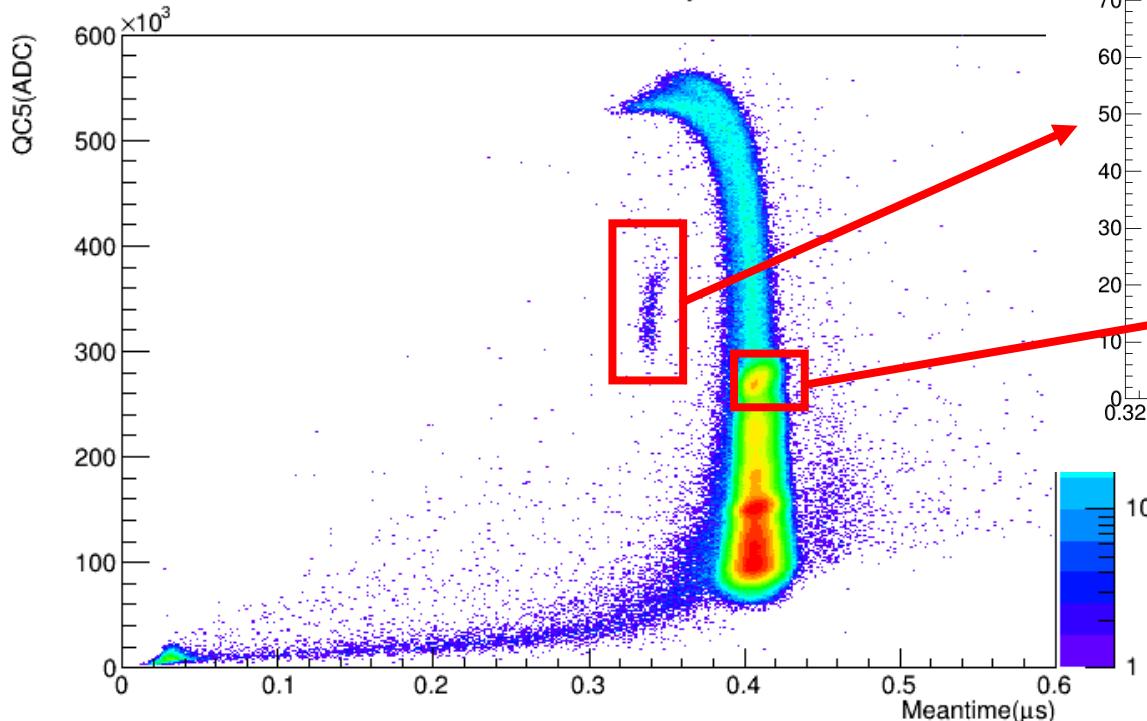

- integration[start to 1.5us] meantime vs adc sum[start to 5us]

PSD(alpha, gamma)

- PSD from alpha events and gamma events using meantime variable

meantime vs qc5

- FoM formula :

$$\frac{Mean_{gamma} - Mean_{alpha}}{\sqrt{\sigma_{alpha}^2 + \sigma_{gamma}^2}}$$

- Alpha events from Po-210
- Gamma peak from Tl-208 gamma decay(2614 keV)

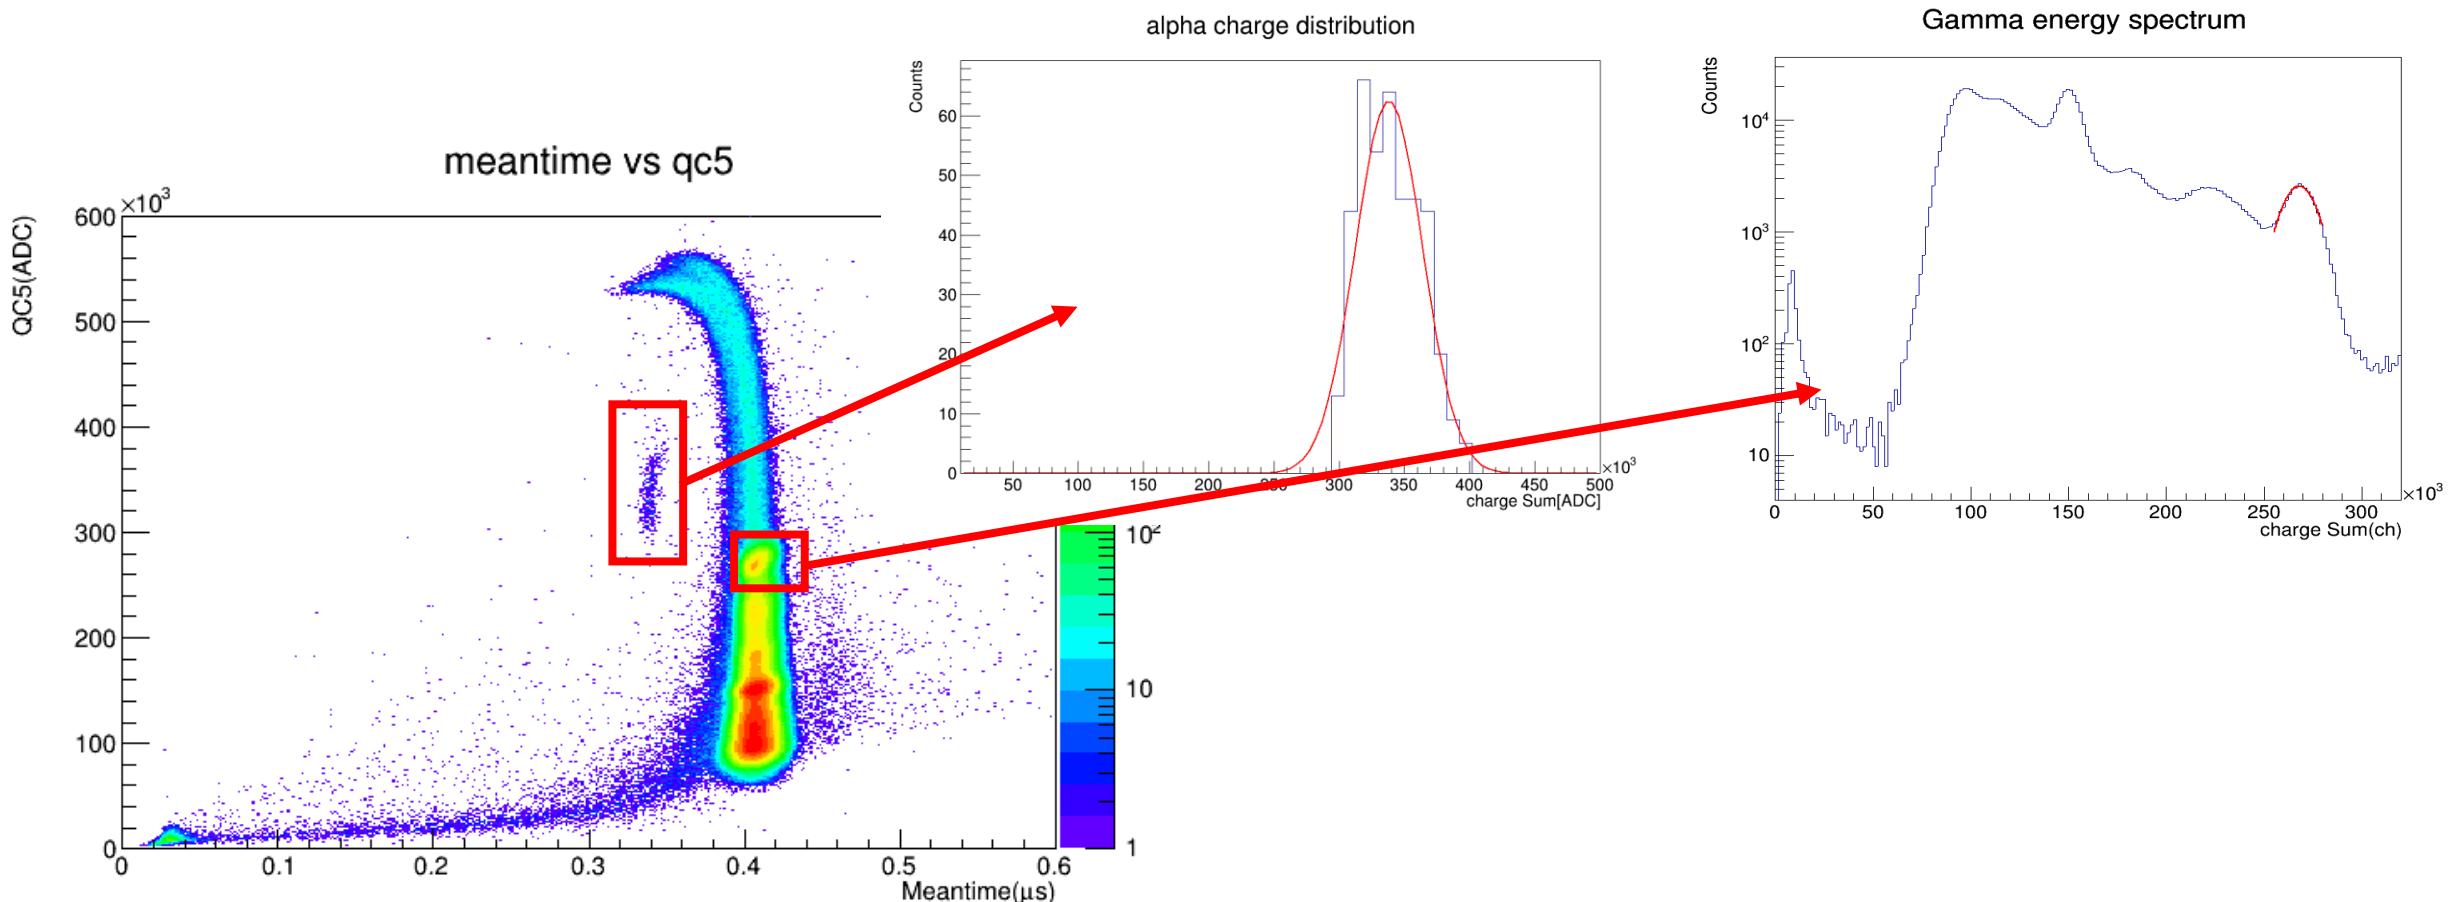

PSD(alpha, gamma) using FoM result

temp	FoM of PSD(alpha, gamma)		
	Integration meantime [start to 1us]	Integration meantime [start to 1.5us]	Integration meantime [start to 2us]
20°C	5.82±0.26	6.06±0.27	5.53±0.32
-33°C	6.03±0.25	7.76±0.36	6.92±0.34

- PSD power at low temperature is better than PSD power at room temperature
- Using integration[start to 1.5us] for PSD is better than using other variables
- **FoM is 28 ± 0.01 % increased at -33°C(meantime 1.5us)**

Light output(alpha, gamma)

- Alpha and gamma(Tl-208) energy spectrum

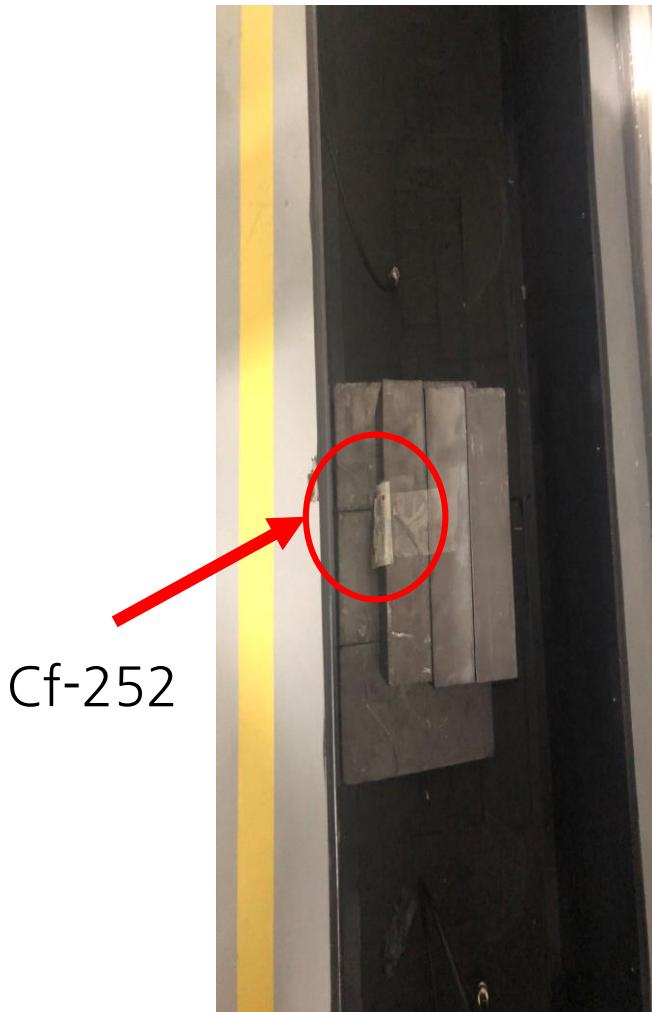

- Alpha events from Po-210
- Gamma peak from Tl-208 gamma decay(2614 keV)

Light output(alpha, gamma)

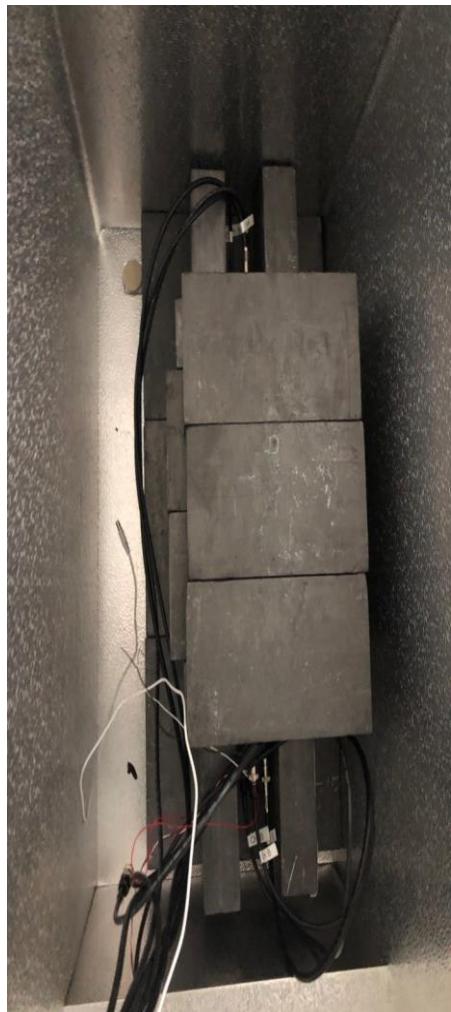

temp	Mean of Charge Sum(light output)		
	Alpha[adc sum]	Gamma(Tl-208) [adc sum]	Ratio(alpha/gamma)
20°C	2.67e5±2.77e3	2.47e5±3.89e2	1.08±0.01
-33°C	3.38e5±1.49e3	2.67e5±7.71e1	1.26±0.005

- Light output(charge sum) is increased at -33°C
- Ratio(alpha/gamma) at -33°C is higher than Ratio at 20°C

Experiment Setup(Neutron)

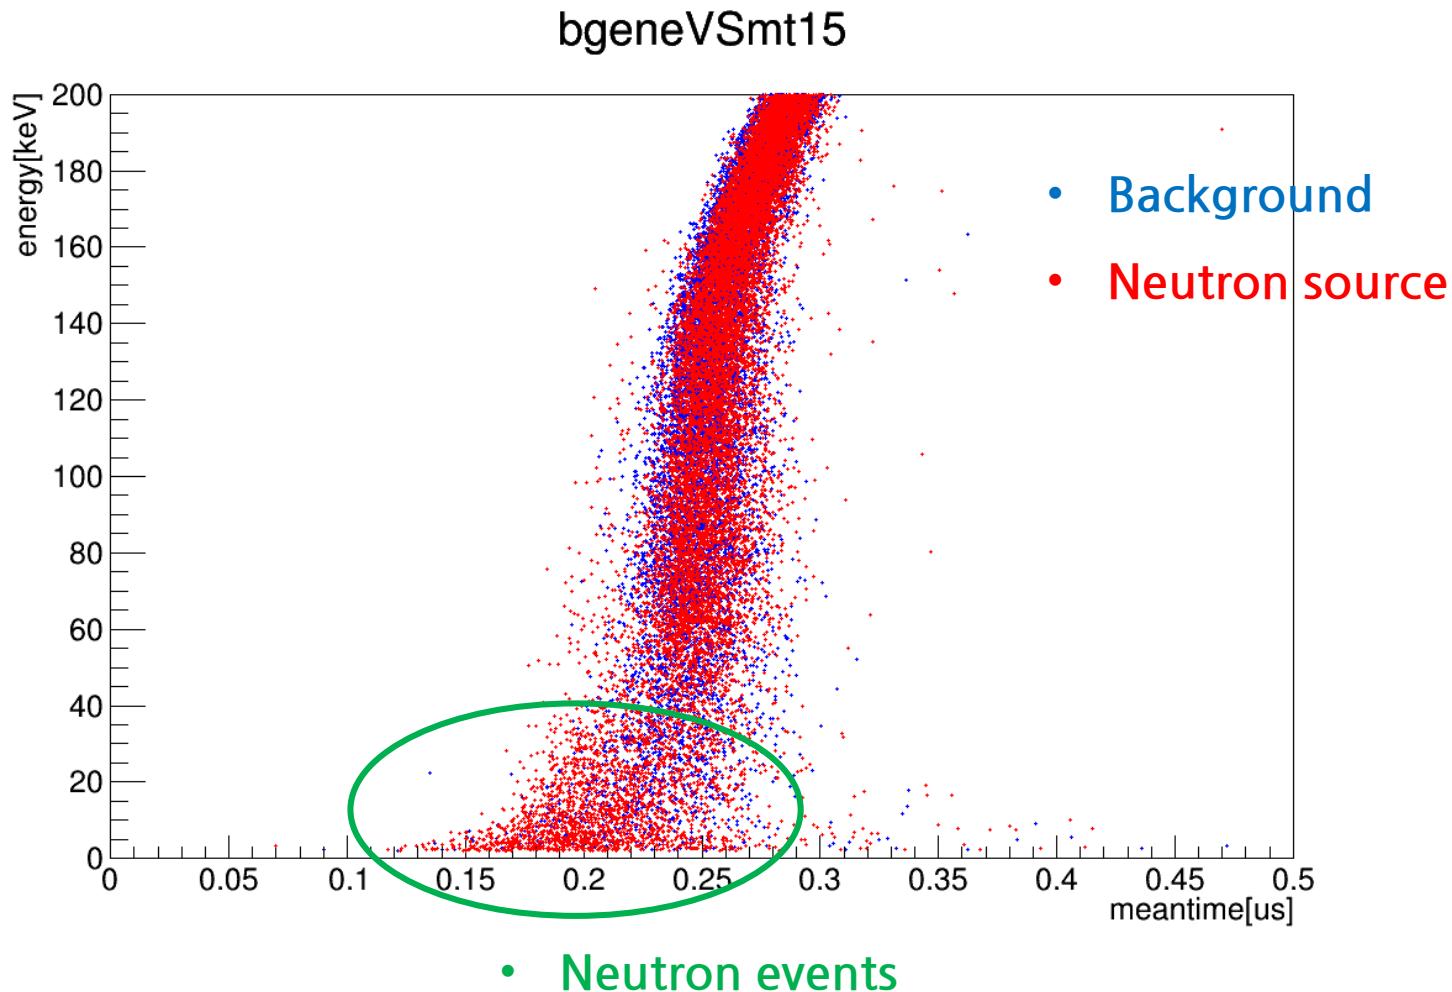

- Outside(in dark box)

- Refrigerator(-33 °C)

- Neutron source : Cf-252
- Shielding thickness : Pb 20cm
- We took data at 20 °C and -33 °C
- Comparing neutron source with background

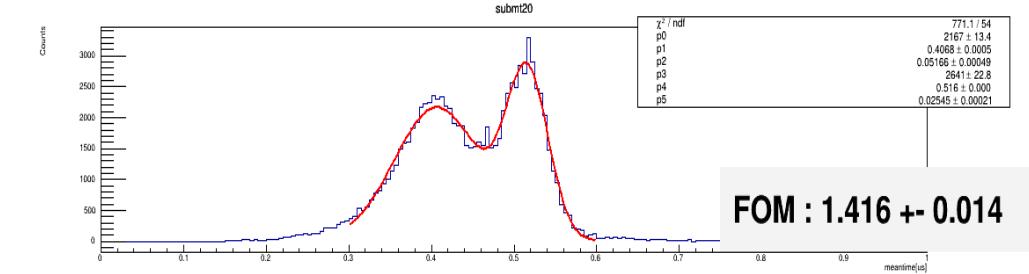

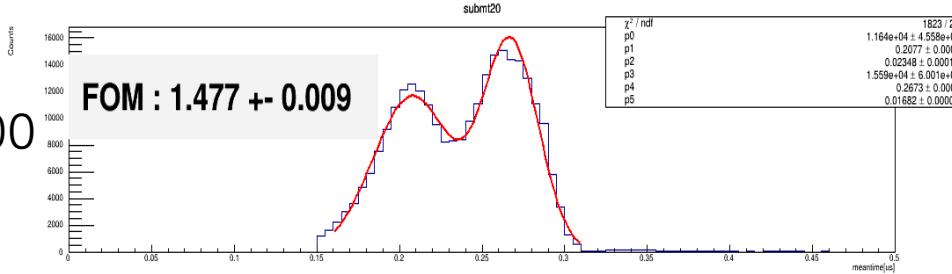

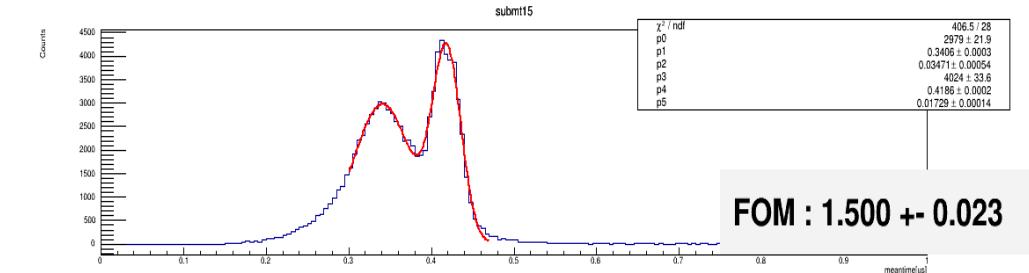

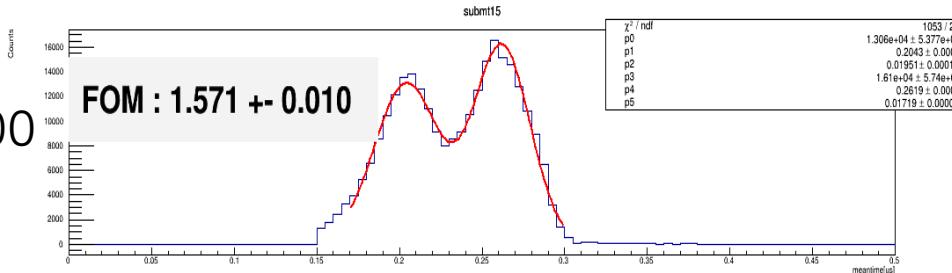

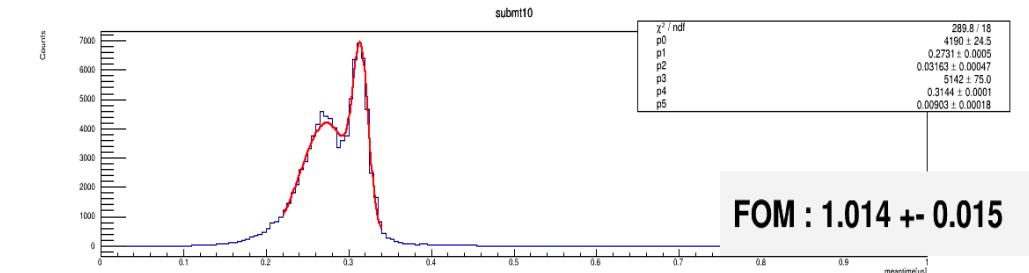

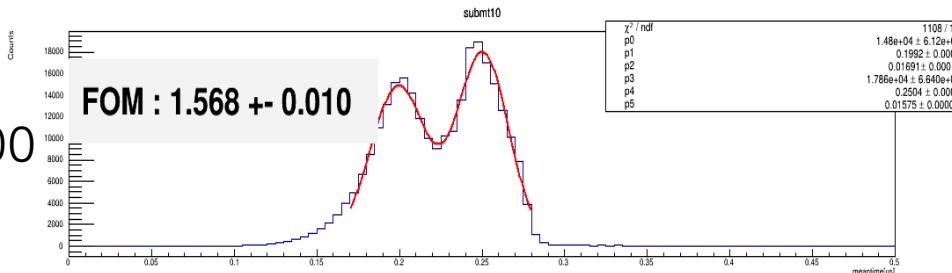

PSD(neutron, gamma)

- Comparing neutron source data with background data

PSD(neutron, gamma)

- Subtract background data from Cf-252 source data (energy cut(2keV < energy <200 keV))

20°C(100 hour data)

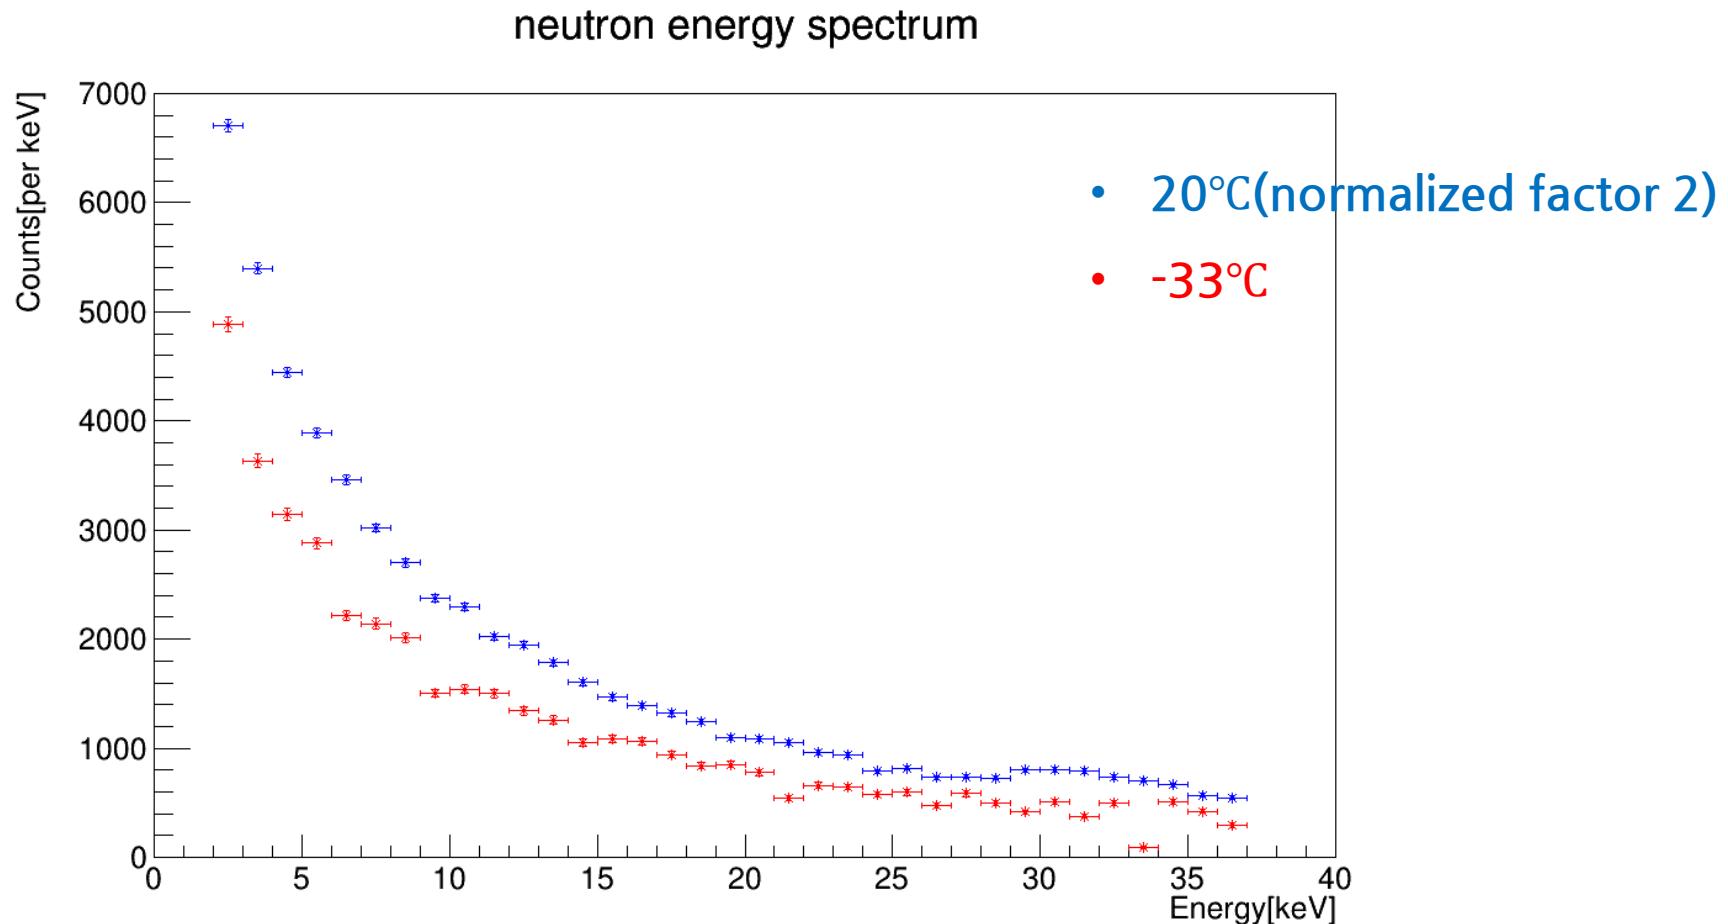

1D meantime

-33°C(50 hour data)

- PSD power at room temperature looks better than PSD power at low temperature (when energy range is 2 keV to 200 keV)

PSD(neutron, gamma)

50 hour data

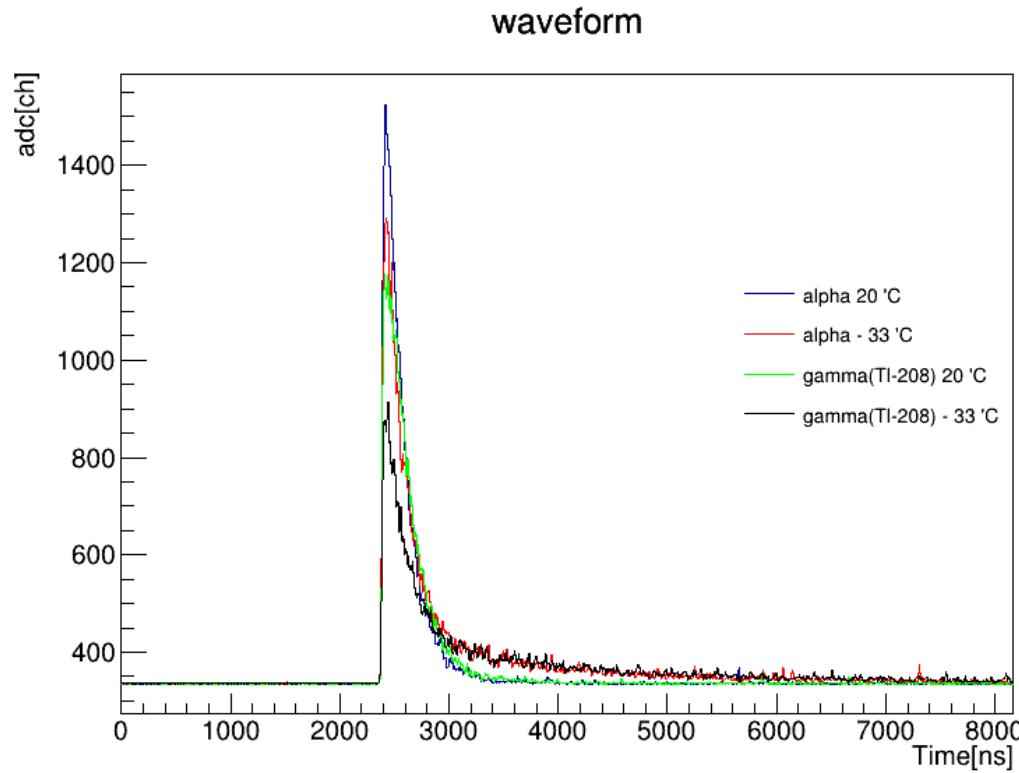

- Using Gaussian fitting, estimating the number of neutron events each energy region(1 keV division)
- Quenching factor of low temperature neutron events could be larger than room temperature neutron events

Conclusion

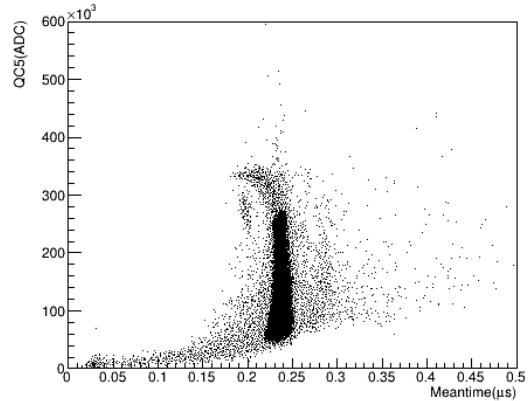

- Alpha PSD power improves by 28% at -33°C compared to the PSD power at 20°C
- Quenching factor of alpha events is higher than that of gamma at -33°C
- Light output is increase at low temperature
- Neutron study is ongoing
