

# The Energy Resolutions of Current Neutrino Mass Measurement Experiments

Kim, Hanbeom

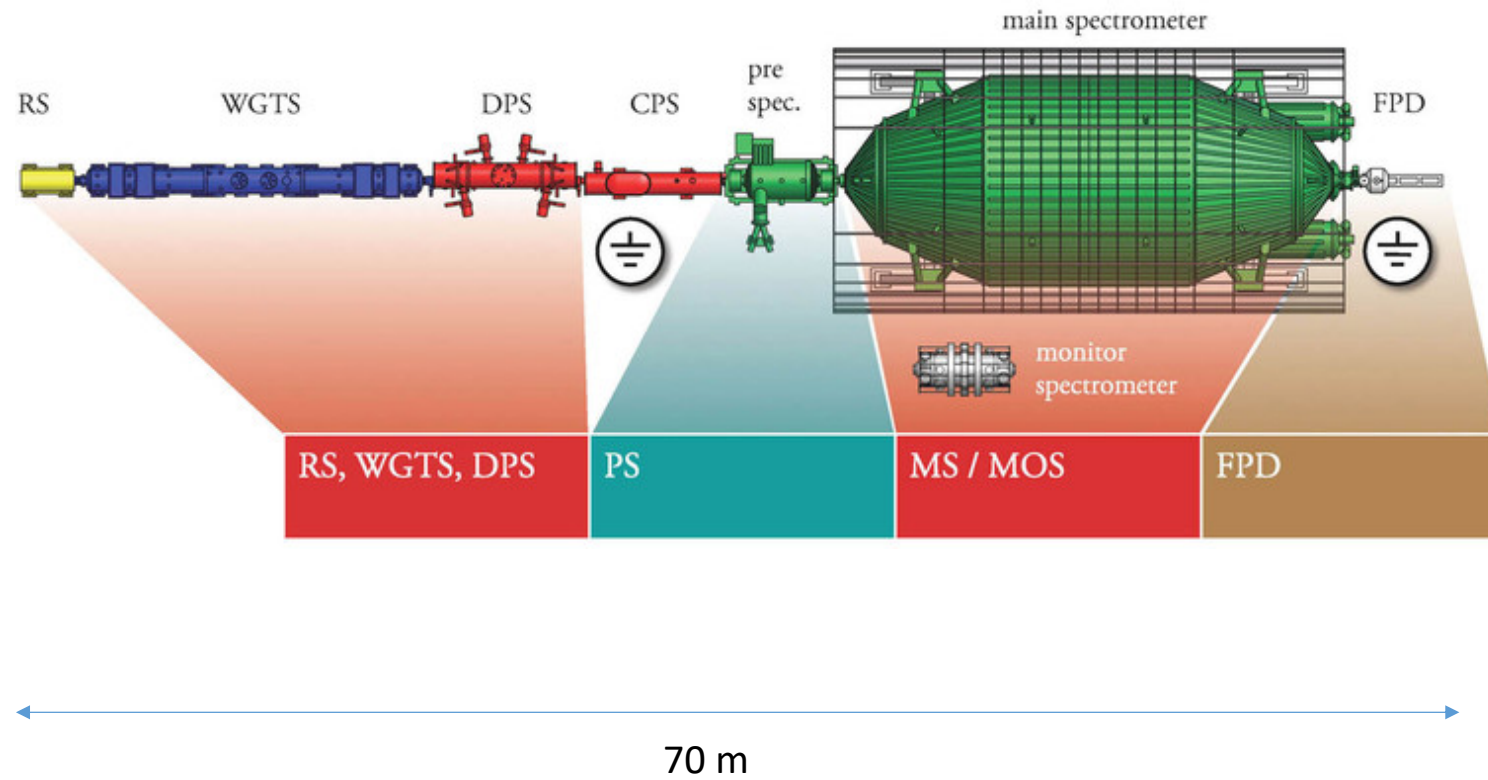

## Introduction

---

- Probing Low Energy Neutrino Backgrounds with Neutrino Capture on Beta Decaying Nuclei, Cocco A, Magnano G and Messina M 2007
- High resolution of energy measurement is required for reasonable rejection of background in relic neutrino detection

- Karlsruhe TRItium Neutrino experiment
- $^3\text{H}$   $\beta$  decay:  $^3\text{H} \rightarrow ^3\text{He}^+ + e^- + \bar{\nu}$
- Expectation:
  1. Improve the upper limit of the mass down to:  
 $2.3 \text{ eV}/c^2$  (Mainz and Troitsk)  $\rightarrow \sim 0.2 \text{ eV}/c^2$
  2. Or discover the actual mass if it is larger than  $0.35 \text{ eV}/c^2$

- Windowless Gaseous Tritium Source (WGTS)

- Transport section

The Differential Pumping Section

The Cryogenic Pumping Section

- Spectrometers
- MAC-E filter (Magnetic Adiabatic Collimation combined with an Electrostatic Filter)
- a special type of spectrometers that guarantee high spectroscopy

# KATRIN

- Spectrometers
- MAC-E filter (Magnetic Adiabatic Collimation combined with an Electrostatic Filter)
- Relative sharpness:  $\frac{\Delta E}{E} = \frac{B_{\min}}{B_{\max}}$

$$T(E, U) = \begin{cases} 0 & \text{for } E \leq qU \\ 1 - \sqrt{1 - \frac{E - qU}{E} \cdot \frac{B_{\text{S}}}{B_{\min}}} & \text{for } qU < E < qU + \Delta E \\ 1 - \sqrt{1 - \frac{B_{\text{S}}}{B_{\max}}} & \text{for } E \geq qU + \Delta E \end{cases}$$
