

Weekly Meeting

01/11/2019

ByungChan Lee

Time Resolution – Position

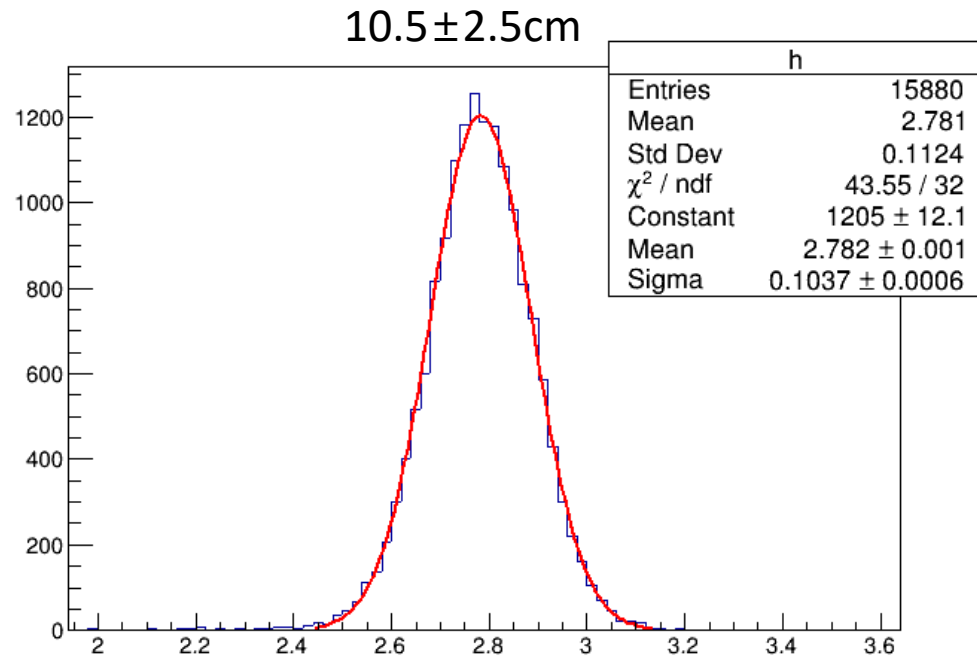

Time Resolution – Position

Rearrangement of reference bars : 10cm → 5cm

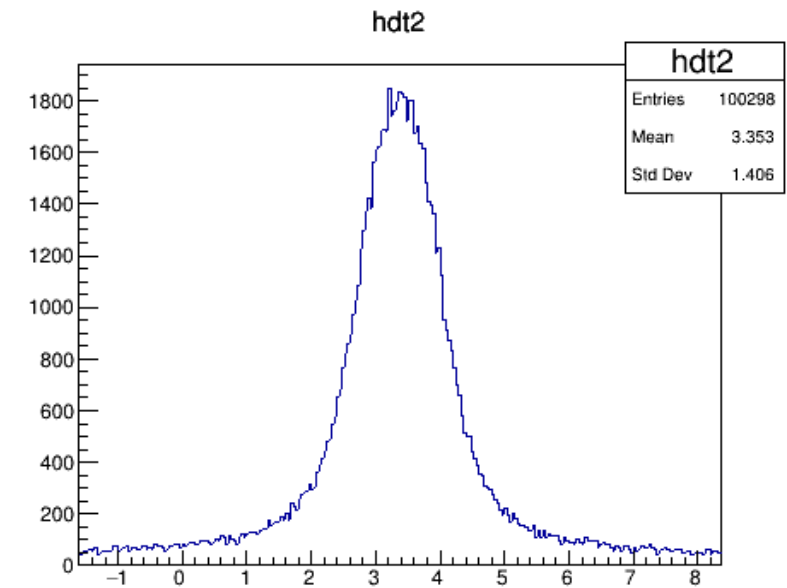

- 0.3 events/sec

Time Resolution – Position

- $t0_{\text{avg}}(2^{\text{nd}} \text{ bar}) - t0_{\text{ref}}$
* $t0_{\text{ref}} = (t0_{\text{avg}}(1^{\text{st}} \text{ bar}) + t0_{\text{avg}}(3^{\text{rd}} \text{ bar}))/2$
- Event Selection (1st & 3rd bars) : $|dt(\text{L-R}) - dt_{\text{mean}}| < 1\sigma$
- Gaussian fitting, 1 Sigma = (10.5 ± 2.5cm) 0.1037 / (85 ± 2.5cm) 0.1202

Time Resolution – Position

Asymmetry in time distribution

- Wrong setting; gain calibration table was wrong..
